

The Kratiste process

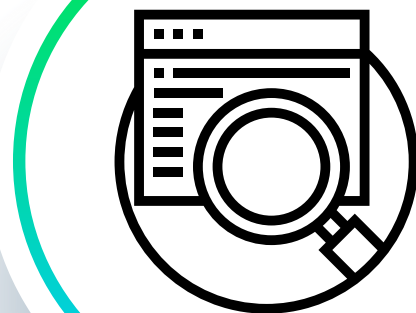

HOW REALLY SUSTAINABLE PLANT SUPPORT IS BEING MADE

STEP 01

Sourcing

We only make 100% natural products, mainly made from plant wastestreams like potato skins and Miscanthus Giganteus (Elephants grass)

Benefit: No plastics or chemicals!

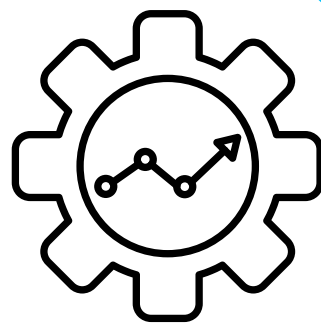

STEP 02

Production

We produce every product in our factory in the Netherlands. This prevents a lot of transportation movements.

Benefit: -10.000 km transport per product in comparison to Asia

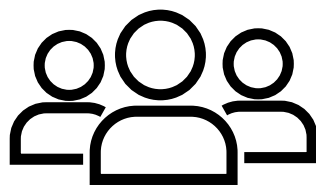

STEP 03

Use

By making our products look & feel like tree bark, the (climbing-) plants are naturally stimulated to grow much better.

Benefit: Better growth of the plant.

STEP 04

End-of-life

Our products are fully biodegradable and recyclable. When thrown away in the plastic bin, the raw material can be recycle. Is it thrown away in the green bin, the material degrades completely.

Benefit: clean and easy end-of-life
